

Computerlinguistik II

Vorlesung im SoSe 2019
(M-GSW-10)

Prof. Dr. Udo Hahn

Lehrstuhl für Computerlinguistik
Institut für Germanistische Sprachwissenschaft
Friedrich-Schiller-Universität Jena

<http://www.julielab.de>

Two Paradigms for NLP

- Symbolic Specification Paradigm
 - Manual acquisition procedures
 - Lab-internal activities
 - Intuition and (few!) subjectively generated examples drive progress based on individual (competence) judgments
 - “I have a system that parses all of my nine-teen sentences!”

Symbolic Specification Paradigm

- **Manual rule specification**
 - Source: linguist's intuition
- **Manual lexicon specification**
 - Source: linguist's intuition
- **Each lab has its own (home-grown) set of NLP software**
 - Hampers reusability
 - Limits scientific progress
 - Waste of human and monetary resources (we “burnt” thousands of Ph.D. student all over the world ☹)

Shortcomings of the “Classical” Linguistic Approach

- Huge amounts of background knowledge req.
 - Lexicons (approx. 100,000 – 150,000 entries)
 - Grammars (>> 15,000 – 20,000 rules)
 - Semantics (>> 15,000 – 20,000 rules)
- As the linguistic and conceptual coverage of classical linguistic systems increases (slowly), it still remains insufficient; systems also reveal ‘spurious’ ambiguity, and, hence, tend to become overly “brittle” and unmaintainable
- More fail-soft behavior is required at the expense of ... ? (e.g., full-depth understanding)

Two Paradigms for NLP

• Symbolic Specification Paradigm

- Manual acquisition procedures
- Lab-internal activities
- Intuition and (few!) subjectively generated examples drive progress based on individual (competence) judgments
 - “I have a system that parses all of my nine-teen sentences!”

• Empirical (Learning) Paradigm

- Automatic acquisition procedures
- Community-wide sharing of common knowledge and resources
- Large and ‘representative’ data sets drive progress according to experimental standards
 - “The system was tested on 1,7 million words taken from the WSJ segment of the MUC-7 data set and produced 4.9% parsing errors, thus yielding a statistically significant 1.6% improvement over the best result by parser X on the same data set & a 40.3% improvement over the baseline system!”

Empirical Paradigm

- Large repositories of language data
 - Corpora (plain or annotated, i.e., enriched by meta-data)
- Large, community-wide shared repositories of language processing modules
 - Tokenizers, POS taggers, chunkers, NE recognizers, ...
- Shared repositories of machine learning algos
- Automatic acquisition of linguistic knowledge
 - Applying ML algos to train linguistic processors by using large corpora with valid linguistic metadata (linguist as educated data supplier, „language expert“) rather than manual intuition (linguist as creative rule inventor)
- Shallow analysis rather than deep understanding
- Large, community-wide self-managed, task-oriented competitions, comparative evaluation rounds
- Change of mathematics:
 - Statistics rather than algebra and logics

Paradigm Shift – We Exchanged our Textbooks...

POS Tagging

A severe infection ended the pregnancy .

DET ADJ NOUN VERB DET NOUN ST

Penn Treebank Tag Set

In total,
45 tags

Tag	Description	Examples
.	sentence terminator	. ! ?
DT	determiner	all an many such that the them these this
JJ	adjective, numeral	first oiled separable battery-powered
NN	common noun	cabbage thermostat investment
PRP	personal pronoun	herself him it me one oneself theirs they
IN	preposition	among out within behind into next
VB	verb (base form)	ask assess assign begin break bring
VBD	verb (past tense)	asked assessed assigned began broke
WP	WH-pronoun	that what which who whom

Transformation Rules for Tagging [Brill, 1995]

- Initial State: Based on a number of features, guess the most likely POS tag for a given word:
 - die/DET Frau/NOUN ,/COMMA die/DET singt/VFIN
- Learn transformation rules to reduce errors:
 - *Change DET to PREL whenever the preceding word is tagged as COMMA*
- Apply learned transformation rules:
 - die/DET Frau/NOUN, /COMMA die/PREL singt/VFIN

First 20 Transformation Rules

#	Change Tag		Condition
	From	To	
1	NN	VB	Previous tag is <i>TO</i>
2	VBP	VB	One of the previous three tags is <i>MD</i>
3	NN	VB	One of the previous two tags is <i>MD</i>
4	VB	NN	One of the previous two tags is <i>DT</i>
5	VBD	VBN	One of the previous three tags is <i>VBZ</i>
6	VBN	VBD	Previous tag is <i>PRP</i>
7	VBN	VBD	Previous tag is <i>NNP</i>
8	VBD	VBN	Previous tag is <i>VBD</i>
9	VBP	VB	Previous tag is <i>TO</i>
10	POS	VBZ	Previous tag is <i>PRP</i>
11	VB	VBP	Previous tag is <i>NNS</i>
12	VBD	VBN	One of previous three tags is <i>VBP</i>
13	IN	WDT	One of next two tags is <i>VB</i>
14	VBD	VBN	One of previous two tags is <i>VB</i>
15	VB	VBP	Previous tag is <i>PRP</i>
16	IN	WDT	Next tag is <i>VBZ</i>
17	IN	DT	Next tag is <i>NN</i>
18	JJ	NNP	Next tag is <i>NNP</i>
19	IN	WDT	Next tag is <i>VBD</i>
20	JJR	RBR	Next tag is <i>JJ</i>

- Guess the next letter:
 - What do you think the next letter is?
- Guess the next word:
 - We are now entering statistical territory

Approximating Natural Language Words

- **zero-order approximation:**
letter sequences are independent of
each other and all equally probable:
 - xfoml rxkhrjffjuj zlpwcwkcy
ffjeyvkcqsghyd

Approximating Natural Language Words

- **first-order approximation:**
letters are independent, but occur
with the frequencies of English text:
 - ocro hli rgwr nmielwis eu ll
nbnesebya th eei alhenhtppa oobttva
nah

Approximating Natural Language Words

- **second-order approximation:**
the probability that a letter appears depends on the previous letter
 - on ie antsoutinys are t inctore st bes
deamy achin d ilonasive tucoowe at
teasonare fuzo tizin andy tobe seace
ctisbe

Approximating Natural Language Words

- **third-order approximation:**
the probability that a certain letter appears depends on the two previous letters
 - in no ist lat whey cratict froure birs
grocid pondenome of demonstures
of the reptagin is regoactiona of cre

Approximating Natural Language Words

- Higher frequency trigrams for different languages:
 - English: THE, ING, ENT, ION
 - German: EIN, ICH, DEN, DER
 - French: ENT, QUE, LES, ION
 - Italian: CHE, ERE, ZIO, DEL
 - Spanish: QUE, EST, ARA, ADO

Zipfsches Gesetz

Wortverteilung im Vergleich zu einer einfachen Zipf-Verteilung ($\sim 1/n$. Wortanzahl: 70;
Texte aus: <http://www.gutenberg.org/dirs/etext04/8effi10.txt>)

Terminology

- **Sentence:** unit of written language
- **Utterance:** unit of spoken language
- **Word Form:** the inflected form that appears literally in the corpus
- **Lemma:** lexical forms having the same stem, part of speech, and word sense
- **Types (V):** number of distinct words that might appear in a corpus (vocabulary size)
- **Tokens (N_T):** total number of words in a corpus (note: $V \ll N_T$)
- **Types seen so far (T):** number of distinct words seen so far in corpus (note: $T \leq V \ll N_T$)

Word-based Language Models

- A model that enables one to compute the probability, or likelihood, of a sentence S , $P(S)$.
- Simple: Every word follows every other word with equal probability (0-gram)
 - Assume $|V|$ is the size of the vocabulary V
 - Likelihood of sentence S of length n is $1/|V| \times 1/|V| \dots \times 1/|V|$
 - If English has 100,000 words, the probability of each next word is $1/100000 = .00001$

Relative Frequency vs. Conditional Probability

- Smarter: *Relative* Frequency

Probability of each next word is related to word frequency within a corpus (unigram)

- Likelihood of sentence $S = P(w_1) \times P(w_2) \times \dots \times P(w_n)$
- Assumes probability of each word is independent of probabilities of other words

Relative Frequency vs. Conditional Probability

- Smarter: *Relative* Frequency

Probability of each next word is related to word frequency within a corpus (unigram)

- Likelihood of sentence $S = P(w_1) \times P(w_2) \times \dots \times P(w_n)$
- Assumes probability of each word is independent of probabilities of other words

- Even smarter: *Conditional* Probability

Look at probability given previous words (n-gram)

- Likelihood of sentence $S = P(w_1) \times P(w_2|w_1) \times \dots \times P(w_n|w_{n-1})$
- Assumes probability of each word is dependent on probabilities of previous words

Generalization of Conditional Probability via Chain Rule

- Conditional Probability for Two Events, A_1 and A_2
 - $P(A_1, A_2) = P(A_1) \cdot P(A_2|A_1)$
- **Chain Rule** generalizes to multiple (n) events
 - $P(A_1, \dots, A_n) =$
 $P(A_1) \times P(A_2|A_1) \times P(A_3|A_1, A_2) \times \dots \times P(A_n|A_1 \dots A_{n-1})$
- Examples:
 - $P(\text{the dog}) = P(\text{the}) \times P(\text{dog} | \text{the})$
 - $P(\text{the dog bites}) = P(\text{the}) \times P(\text{dog} | \text{the}) \times P(\text{bites} | \text{the dog})$

Relative Frequencies and Conditional Probabilities

- Relative word frequencies are better than equal probabilities for all words
 - In a corpus with 10K word types, each word would have $P(w) = 1/10K$
 - Does not match our intuitions that different words are more likely to occur
 - (e.g. “the” vs. “shop” vs. “aardvark”)
- Conditional probability is more useful than individual relative word frequencies
 - **dog** may be relatively rare in a corpus
 - but if we see **barking**, $P(\text{dog}|\text{barking})$ may be large

Probability for a Word String

- In general, the probability of a complete string of words $w_1^n = w_1 \dots w_n$ is

$$\begin{aligned} P(w_1^n) \\ &= P(w_1)P(w_2/w_1)P(w_3/w_1 \ w_2) \dots P(w_n/w_1 \dots w_{n-1}) \\ &= \prod_{k=1}^n P(w_k | w_1^{k-1}) \end{aligned}$$

- But this approach to determining the probability of a word sequence gets to be computationally very expensive and suffers from sparse data

Markov Assumption (basic idea)

- How do we (efficiently) compute $P(w_n | w_1^{n-1})$?
- Trick (!): Instead of $P(\text{rabbit} | \text{I saw } \underline{a})$, we use $P(\text{rabbit} | \underline{a})$.
 - This lets us collect statistics in practice via a bigram model: $P(\text{the barking dog}) = P(\text{the} | \text{<start>}) \times P(\text{barking} | \text{the}) \times P(\text{dog} | \text{barking})$

Markov Assumption (the very idea)

- Markov models are the class of probabilistic language models that assume that we can predict the probability of some future unit *without looking too far* into the past
 - Specifically, for $N=2$ (bigram):
 - $P(w_1^n) \approx \prod_{k=1}^n P(w_k | w_{k-1}); w_0 := \text{<start>}$
- Order of a Markov model: length of prior context
 - bigram is first order, trigram is second order, ...

Statistical HMM-based Tagging

[Brants, 2000]

- *State transition probability*. Likelihood of a tag immediately following n other tags
 - $P_1(\text{Tag}_i \mid \text{Tag}_{i-1} \dots \text{Tag}_{i-n})$
 - *State emission probability*. Likelihood of a word given a tag
 - $P_2(\text{Word}_i \mid \text{Tag}_i)$
-
- die/DET Frau/NOUN ,/COMMA die/DET or PREL singt/VFIN

Trigrams for Tagging

- *State transition probabilities (trigrams):*

- $P_1(\text{DET} \mid \text{COMMA NOUN}) = 0.0007$

- $P_1(\text{PREL} \mid \text{COMMA NOUN}) = 0.01$

- *State emission probabilities:*

- $P_2(\text{die} \mid \text{DET}) = 0.7$

- $P_2(\text{die} \mid \text{PREL}) = 0.2$

- Compute probabilistic evidence for the tag being

- **DET:** $P_1 \cdot P_2 = 0.0007 \cdot 0.7 = 0.00049$

- **PREL:** $P_1 \cdot P_2 = 0.01 \cdot 0.2 = 0.002$

Taken from
(POS-
annotated)
corpora

• die/DET Frau/NOUN ,/COMMA die/PREL singt/VFIN

Inside (most) POS Taggers

- Lexicon look-up routines
- Morphological processing (not only deflection!)
- Unknown word handler, if lexicon look-up fails (based on statistical information)
- Ambiguity ranking (priority selection)

Chunking Principles

- Goal: divide a sentence into a sequence of chunks (ako phrases)
- Chunks are non-overlapping regions of a text
 - *[I] saw [a tall man] in [the park]*
- Chunks are non-exhaustive
 - not all words of a sentence are included in chunks
- Chunks are non-recursive
 - a chunk does not contain other chunks
- Chunks are mostly base NP chunks

[*[the synthesis]*_{NP-base} *of* *[long enhancer transcripts]*_{NP-base}]_{NP-complex}

step	NN	I

A Simple Chunking Technique

- Simple chunkers usually ignore lexical content
 - Only need to look at part-of-speech tags
- Basic steps in chunking
 - Chunking / Unchunking
 - Chinking
 - Merging / Splitting

Regular Expression Basics

- “|” OR operator (explicit OR-ing)
 - “[a|e|i|o|u]” matches any occurrence of vowels
- “[abc]” matches any occurrence of either “a”, “b” or “c” (implicit OR-ing)
 - “gr[ae]y” matches “grey” or “gray” (but not “graey”)
- “.” matches arbitrary char
 - “d.g” matches “dag”, “dig”, “dog”, “dkg” ...
- “?” preceding expression/char may or may not occur
 - “colou?r” matches “colour” and “color”
- “+” preceding expression occurs at least one time
 - “(ab)+” matches “ab”, “abab”, “ababab”, ...
- “*” preceding expression occurs null time or arbitrary often
 - “(ab)*” matches “_”, “ab”, “abab”, “ababab”, ...

Chunking

- Define a regular expression that matches the sequences of tags in a chunk
 - `<DT>? <JJ>* <NN.??>`
- Chunk all matching subsequences
 - *A/DT red/JJ car/NN ran/VBD on/IN the/DT street/NN*
 - *[A/DT red/JJ car/NN] ran/VBD*
on/IN [the/DT street/NN]
- If matching subsequences overlap, the first one gets priority
- **Unchunking** is the opposite of chunking

Chinking

- A chink is a subsequence of the text that is not a chunk
- Define a regular expression that matches the sequences of tags in a chink
 - (<VB.??> | <IN>)+
- Chunk anything that is not a matching subsequence
 - *A/DT red/JJ car/NN ran/VBD on/IN the/DT street/NN*
 - [*A/DT red/JJ car/NN*]

ran/VBD on/IN [*the/DT street/NN*]

chink

Merging

- Combine adjacent chunks into a single chunk
- Define a regular expression that matches the sequences of tags on both sides of the point to be merged
 - Merge a chunk ending in “JJ” with a chunk starting with “NN”, i.e. left: <JJ>, right: <NN.>
- Chunk all matching subsequences
 - [A/DT *red*/JJ] [*car*/NN] *ran*/VBD
on/IN *the*/DT *street*/NN
 - [A/DT *red*/JJ *car*/NN] *ran*/VBD
on/IN *the*/DT *street*/NN
- **Splitting** is the opposite of merging

Concluding Remarks

- Chunking – as the weakest form of syntactic structuring – relies on RegExs
- RegExs (formally) belong to the class of regular grammars
- Regular grammars and their (finite-state) automata have linear run-time complexity
- Standard CF grammars and their associated push-down automata have (at best) cubic run-time complexity
- Hence, there is a trade-off between different levels of richness of syntactic structures and gains/losses of run-time behavior

What are Named Entities?

- Names of persons
 - *Dr. Jonathan Peeko, Professor Johnson*
- Names of companies or organizations
 - *Sony, United Nations, Texas Instruments, General Motors*
- Names of locations
 - *Paris, San Francisco, Rocky Mountains, Yellowstone Park*
- Date and time expressions
 - *Feb 17, 1973; 4.40p.m.; 16.40 Uhr; autumn 2000; last year*
- Addresses
 - *7 Ugly Way, Wolverhampton W40 1Q5*
 - *udo.hahn@uni-jena.de*
- Names of proteins or genes or diseases,
 - *chloramphenicol acetyltransferase, NF-kappa B, SARS*
- Measure expressions
 - *420 kp, 21 l/m², 37%, 900€*

GATE: NER – Examples (1/3)

NYT19980403.0453 NEWS STORY 04/03/1998 21:01:00 CREDIT WARNING BY MOODY'S ON JAPANESE BONDS TOKYO _ Borrowers in Japan, including even the healthiest corporations, faced a new challenge on Friday as Moody's Investors Service provided a pessimistic outlook on the nation's pristine credit rating. The exchange rate of Japan's currency, the yen, tumbled to a six-and-a-half-year low, and the stock and bond markets fell on the decision by the American-based ratings agency to change its view on Japan _ whose government debt has been rated triple-A _ from ``stable'' to ``negative.'' Moody's did not change any existing bond ratings, but the negative outlook may lead to a formal review in 18 months to two years. A lowered rating could raise borrowing costs for all Japanese, from consumers to large corporations, even those with impeccable credit. And such a move could further weaken Japanese banks, which already pay more to borrow because they hold in excess of \$600 billion in bad loans. The step by Moody's was a surprise because even with Japan's economic problems, it is still the world's largest creditor nation and there is little doubt about its ability to repay debts. But the announcement showed that Moody's _ one of the world's big credit raters, along with Standard & Poor's and Duff & Phelps _ was beginning to rethink Japan's long-term prospects. In trading here Friday the dollar surged to 135.42 yen, the highest since September 1991, before recovering a little. The benchmark Nikkei index of 225 stocks fell for the third consecutive day _ to a four-month low of 15,517.78. Bond prices also declined, pushing the yield on the key 10-year Japanese government bond to 1.685 percent, a six-week high. Bond prices and yields move in opposite directions ``The world doesn't trust Japan anymore, even though Japan has lots of money.'' commented Xinyi Lu of Paribas

GATE: NER – Examples (3/3)

NYT19980403.0456 NEWS STORY
04/03/1998 21:02:00 BUOYANT CLINTON TAKES ON GOP SENATORS, BIG TOBACCO
WASHINGTON _ Eager to shift the spotlight from Paula Jones back to the
business of government, President Clinton lambasted the Republican
Senate budget proposal on Friday and warned tobacco companies to go
along with a proposed settlement. Tired but buoyant in his first day
back at the Oval Office after 12 days in Africa, Clinton immediately
assembled his economic team in the White House Rose Garden this
morning and signaled an election-year showdown with congressional
Republicans over the budget for the 1999 fiscal year. While clearly
emboldened by a federal judge's dismissal on Wednesday of Mrs. Jones'
sexual misconduct lawsuit, the president vowed not to be distracted by
such matters, saying, "I am going on with my business." Instead,
Clinton castigated Senate Republicans for approving a \$1.73 trillion
spending plan on Thursday night that calls for modest tax cuts and
excludes virtually all of the president's proposals for new spending.
And he scolded members of the House for passing a six-year, \$217
billion transportation bill packed with projects for almost every
congressional district. "I am very concerned that the budget plan now
working its way through the Senate will squeeze out critical
investments in education and children," Clinton said. "I'm also

Two Types of NER Methods

Human Knowledge Engineering (symbolic p.)

- rule based
- developed by experienced language engineers
- based on human intuition
- requires only small amount of plain training data
- development can be very time consuming
- some changes may be hard to accommodate

(Supervised) Machine Learning Systems (empir.p.)

- use statistics or other machine learning technique
- developers do (almost) not need linguistic expertise
- fully automatic
- requires large amounts of annotated training data
- annotators are cheap (but you get what you pay for!)
- some changes may require re-annotation of the entire training corpus

Naïve NER Method: List Look-up

- Recognize entities stored in given lists
 - *gazetteers*, e.g., online phone directories, yellow pages)
- Advantages:
 - simple, fast, language independent, easy to retarget (just create lists)
- Disadvantages:
 - impossible to enumerate all names and name variants, collection and maintenance of lists

NER by Pattern Recognition

- Names often have internal structure - these components can be either stored or guessed, e.g., for "Location" we have RegEx-style constraints such as:

Capitalized Word + {City, Forest, Center, River}

which yields: *Sherwood Forest, Manchester City, Rhine River*

Capitalized Word + {Street, Boulevard, Avenue, Road}

which yields: *Portobello Street, Washington Avenue*

NER by Expressive Rules

- Context-sensitive rules of the kind:

$$A \rightarrow B \setminus C / D$$

- A is a set of attribute-value expressions and optional score, the attributes refer to elements of the input token feature vector
- B, C, D are sequences of attribute-value pairs and regular expressions; variables are also supported
- B and D are left and right context, respectively, and can be empty (hint: read backwards!)

Example: `[syn=NP, sem=ORG] (0.9) →
 \ [norm="university"], [token="of"],
 [sem=REGION|COUNTRY|CITY] / ;`

NER by Machine Learning

- NE task is frequently broken down in two parts:
 - Recognizing the entity boundaries
 - Classifying the entities in the NE categories
- Features are at least as important as the choice of the ML method
 - Simple pattern matching of orthographic features: capitalization, punctuation marks, numerical symbols
 - Windows for lexical features (e.g., “Mr.” for persons)
 - Affix features (“-ase” for proteins, “-ectomy” for medical procedures, etc.)
 - POS info (and chunks)

Merkmale für die Zuordnung von Named Entities

Feature	Explanation
Lexical items	The token to be labeled
Stemmed lexical items	Stemmed version of the target token
Shape	The orthographic pattern of the target word
Character affixes	Character-level affixes of the target and surrounding words
Part of speech	Part of speech of the word
Syntactic chunk labels	Base-phrase chunk label
Gazetteer or name list	Presence of the word in one or more named entity lists
Predictive token(s)	Presence of predictive words in surrounding text
Bag of words/Bag of N-grams	Words and/or <i>N</i> -grams occurring in the surrounding context

Shape	Example
Lower	cummings
Capitalized	Washington
All caps	IRA
Mixed case	eBay
Capitalized character with period	H.
Ends in digit	A9
Contains hyphen	H-P

Named Entity Tagging als Sequence Labeling-Problem

Systemarchitektur für (überwachtes) Maschinelles Lernen

Merkmale

= beobachtbare Indikatoren
(in den Trainingsdaten)

Algorithmen für Maschinelles Lernen

= Rechenverfahren zur Bestimmung von
(statistischen) Modellen über die Verteilung von
Merkmalen (in den Trainingsdaten)

Algorithmen für (überwachtes) Maschinelles Lernen [Flach 2012, Murphy 2012]

- Einfache Klassifikatoren (Classifier)
 - Naive-Bayes'scher Klassifikator
 - k-Nächster Nachbar (k-nearest neighbor)
 - Entscheidungsbäume (decision trees)
- Hochdimensionale Klassifikatoren (Classifier)
 - Support Vector Machines (SVM)
- (strukturorientierte) Graphische Modelle
 - Hidden-Markov-Modelle
 - Conditional Random Fields (CRF)
 - Bayes'sche Netze
- (Künstliche) neuronale Netze \Rightarrow Deep Learning
- Genetische Algorithmen

Machine Learning–General Task

A computer program is said to *learn*

- from experience E (data in the form of representative examples / instances of the whole input space)
 - with respect to some class of tasks T
 - and performance measure P ,
 - if its performance at tasks T as measured by P , improves with experience E
-
- Learned hypothesis: model of problem/task T
 - Model quality: accuracy/performance measured by P

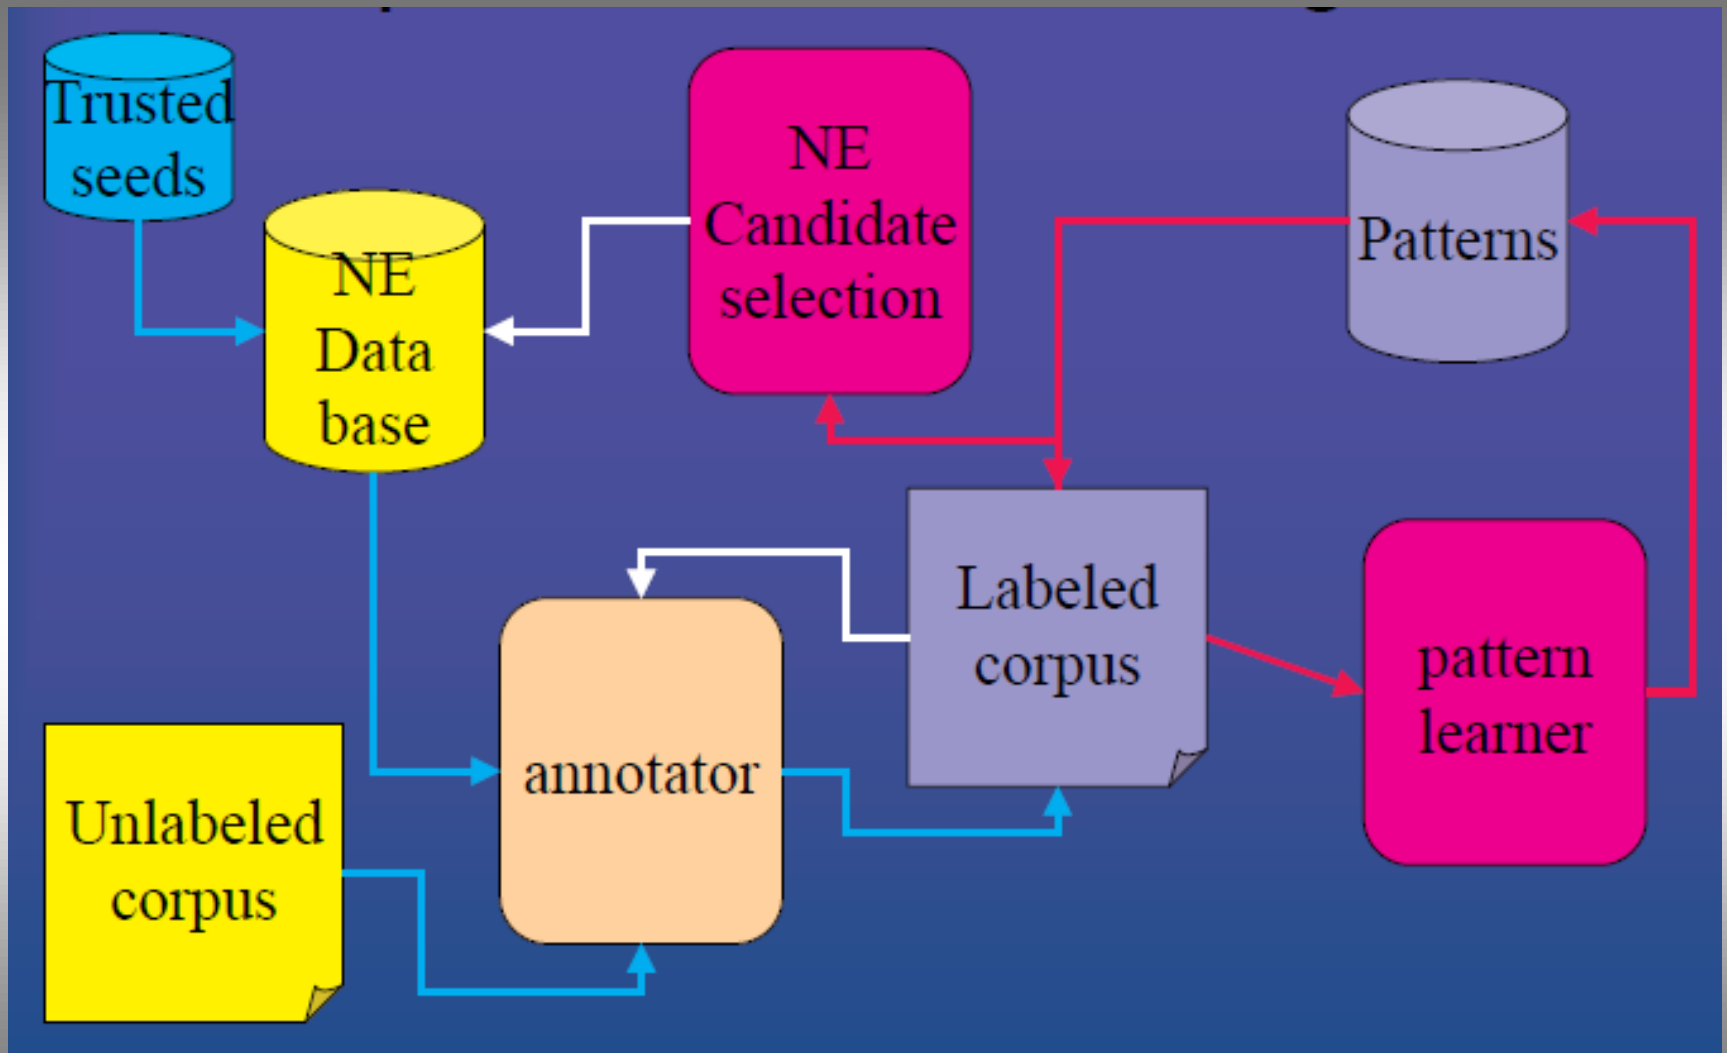

Machine Learning – Two Fundamental Modes

- Supervised learning
 - Given : Training examples (training set T)
 $\{ (x_1, f(x_1)), (x_2, f(x_2)), \dots (x_n, f(x_n)) \}$
for some unknown function $y = f(x)$
 - Find : $f(x)$
 - Predict $y' = f(x')$ where x' is not in the training set but T-wise similar data sets
- Unsupervised learning
 - Given : data (data set D)
 $\{ x_1, x_2, \dots, x_n \}$
for some unknown function $y = f(x)$
 - Find : $f(x)$
 - Predict $y = f(x)$ where x is in the data set or D-wise similar data sets

Basic Idea for (Almost) Unsupervised NER

- Define manually only a small set of trusted seeds (a bit of ground truth)
- Training then only uses unlabeled data
- Initialize system by labeling the corpus with the seeds
- Extract and generalize patterns from the context of the seeds
- Use the patterns to further label the corpus and to extend the seed set (*bootstrapping*)
- Repeat the process unless no new terms can be identified

Architecture for (Almost) Unsupervised NER

Learning Ordered Decision Rules

- The task: to learn a decision list to classify strings as **person**, **location** or **organization**

The learned decision list is an *ordered* sequence of if-then rules

... says *Mr. Gates*, founder of *Microsoft* ...

... says *Mr. Gates*, founder of *Microsoft* ...

R_1 : if features then **person**
 R_2 : if features then **location**
 R_3 : if features then organization
...
 R_n : if features then **person**

Outline of Unsupervised Co-Training

- Parse an unlabeled document set  syntactic units
- Extract each NP whose head is tagged as Proper Noun (Proper Noun is supertype of NER as subtyping)
- Define a set of relevant features which can be applied to extracted NPs
- Define two separate types of rules on the basis of the feature space
- Determine small initial set of seed rules
- Iteratively extend the rules through co-training

Two Types of Rules

- **Spelling Rules**
 - Rules which directly specify lexical conditions (e.g., “Mr.”
⇒PERSON)
- **Contextual Rules**
 - Rules which specify co-occurring lexical or phrasal conditions (e.g., “president” co-occurs with “Mr.”
⇒PERSON)
- **N.B.: Huge amount of unlabeled data in a corpus gives useful hints!**

Kinds of Noun Phrases and Spelling-Context Pairs

1. There was an appositive modifier to the NP, whose head is a singular noun (tagged NN).

- ...says [Maury Cooper], [a vice president]...

2. The NP is a complement to a preposition which is the head of a PP. This PP modifies another NP whose head is a singular noun.

- ... fraud related to work on [a federally funded sewage plant] [in [Georgia]].

- ...says Maury Cooper, a vice president...
 - (Maury Cooper, president)

- ... fraud related to work on a federally funded sewage plant in Georgia.
 - (Georgia, plant_in)

Features

- Set of spelling features
 - Full-string=x (full-string=Maury Cooper)
 - Contains(x) (contains(Maury))
 - Allcap1 IBM
 - Allcap2 N.Y.
 - Nonalpha=x A.T.&T. (nonalpha=..&.)
- Set of context features
 - Context = x (context = president)
 - Context-type = x appos or prep

Examples of Features

<u>Sentence</u>	<u>Entities(Spelling/Context)</u>	<u>(Active) Features</u>
But Robert Jordan, a partner at Steptoe & Johnson who took ...	Robert Jordon/partner	Full-string=Robert_Jordan, contains(Robert), contains(Jordan), context=partner, context-type=appos
	Steptoe & Johnson/partner_at	Full-string=Steptoe_&_Johnson, contains(Steptoe), contains(&), contains(Johnson), nonalpha=& , context=partner_at, context-type=prep
By hiring a company like A.T.&T. ...	A.T.&T./company_like	Full-string= A.T.&T., allcap2, nonalpha=..&.. , context=company_like, context-type=prep
Hanson acquired Kidde Incorporated, parent of Kidde Credit, for ...	Kidde Incorporated/parent	Full-string=Kidde_Incorporated, contains(Kidde), contains(Incorporated), context=parent, context-type=appos
	Kidde Credit/parent_of	Full-string=Kidde_Credit, contains(Kidde), contains(Credit), context=parent_of, context-type=prep

Formal Structure of Rules

Rules

Two separate types of rules:
Spelling rules
Context rules

Feature \rightarrow NE-type, $h(\text{Feature}, \text{NE-type})$

$h(x, y)$: the strength of a rule, defined as

$Count(x, y)$ is the number of times feature x is seen with label y in training data,

$$\max_{x, y} \frac{Count(x, y) + \alpha}{Count(x) + k\alpha}$$

where

$$Count(x) = \sum_{y \in Y} Count(x, y)$$

α is a smoothing parameter

$$k = \#NE\text{-types}$$

Is an estimate of the conditional probability of the NE-type given the feature, $P(y|x)$

The rules ordered according to their strengths h form a decision list: the sequence of rules are tested in order, and the answer to the **first** satisfied rule is output.

7 Seed Rules

7 SEED RULES

- Full-string = New York → Location
- Full-string = California → Location
- Full-string = U.S. → Location
- Contains(Mr.) → Person
- Contains(Incorporated) → Organization
- Full-string=Microsoft → Organization
- Full-string=I.B.M. → Organization

Note: only one type of rules used as seed rules, and all NE-types should be covered

Co-Training Algorithm

1. Set $N=5$ (max. # of rules of each type induced in each iteration)
2. **Initialize**: Set the **spelling** decision list equal to the set of seed rules. Label the training set using these rules.
3. Use **these** to get contextual rules. (x = feature, y = label)
 1. Compute $h(x,y)$, and induce at most $N * K$ rules $K = \# \text{ NE types}$
 2. all must be above some threshold $p_{\min}=0.95$
4. Label the training set using the contextual rules.
5. Use these to get $N*K$ **spelling** rules (same as step 3.)
6. Set **spelling** rules to seed plus the new rules.
7. If $N < 2500$, set $N=N+5$, and goto step 3.
8. Label the training data with the combined spelling/contextual decision list, then induce a final decision list from the labeled examples where all rules (regardless of strength) are added to the decision list.

Example

- (IBM, company)
 - ...IBM, the company that makes...
- (General Electric, company)
 - ..General Electric, a leading company in the area,...
- (General Electric, employer)
 - ... joined General Electric, the biggest employer...
- (NYU, employer)
 - NYU, the employer of the famous Ralph Grishman,...

Power of the Algorithm

- Greedy method
 - At each iteration method increases number of rules
 - While maintaining a high level of agreement between spelling & context rules

For $n = 2500$:

1. The two classifiers give both labels on 49.2% of the unlabeled data
 2. And give the *same* label on 99.25% of these cases
- The algorithm maximizes the number of unlabeled examples on which the two decision list agree.

Evaluation of the Algorithm

- 88,962 (spelling, context) pairs.
 - 971,746 sentences
- 1,000 randomly extracted to be test set.
- Location, person, organization, noise (items outside the other three)
- 186, 289, 402, 123 (- 38 temporal noise).
- Let N_c be the number of correctly classified examples
 - Noise Accuracy: $N_c / 962$

Results

<u>Algorithm</u>	<u>Clean Accuracy</u>	
Baseline	45.8%	
EM	83.1%	
Yarowsky 95	81.3%	
Yarowsky Cautious	91.2%	
DL-CoTrain	91.3%	
CoBoost	91.1%	

Remarks

- Needs full parsing of unlabeled documents
 - Restricted language independency
 - Need linguistic sophistication for new types of NE
- Slow training
 - In each iteration, full size of training corpus has to be re-labeled

Resources for NLP

- Empirical (Learning) Paradigm for NLP
- **Types of Resources**
 - Language data (plain, annotated)
 - Systems for acquiring and maintaining language data
 - Computational lexicons and ontologies
 - NLP Core Engines
 - NLP Application Systems
 - Machine Learning Resources
- Methodological Issues of NLP Resources

Ressourcen für die Sprachverarbeitung

- Referenzkorpora (Nationalkorpora)
 - Standardsprache (Zeitungen, Belletristik)
- Non-Standard-Korpora
 - Informelle Sprache (Chats, Blogs, E-Mails)
 - Fachsprachen (z.B.: klinische Berichte)
- Rohdaten vs. Annotation
 - Linguistische Metadaten
 - Morphologie, Syntax, Semantik, Pragmatik

Language Data

- **Plain language data**
 - Just text or speech
 - ASCII/UTF-8-compatible, pdf, HTML/SGML
- **Annotated language data**
 - Enriched by linguistic meta-data
 - Linguistic annotation languages (XML)

Plain Language Data

- **Mixed/Balanced text collections**
 - British National Corpus (BNC)
 - American National Corpus (ANC)
- **Newspaper collections**
 - Wall Street Journal
 - IdS-Korpora (DeReKo*)
- **The Web**

British National Corpus (BNC)

- 100M word collection (some 4,050 texts) of 20th century British English
- Written part (90%)
 - Regional and national newspapers
 - Specialist periodicals and journals (various genres)
 - Academic books and popular fiction
 - Letters, memoranda, school and university essays
- Spoken part (10%)
 - Informal conversations (different ages, regions, social classes)
 - Formal business and government meetings
 - Radio shows and phone-ins
- <http://www.natcorp.ox.ac.uk/>

British National Corpus (BNC)

- Encoding based on ‘Guidelines of the Text Encoding Initiative’ (TEI),
 - using ISO standard 8879 (SGML: Standard Generalized Markup Language)
- Whole collection is POS-tagged
 - using the CLAWS tagger for the C5 tag set (C7 is much more elaborate)
 - Error rate: 1.7%
 - Tagging ambiguity for 4.7% of all tags

American National Corpus (ANC)

- 15M word collection (texts) of 20th century American English
- Annotated for structural markup (sections, chapters, etc.) down to the level of paragraph, sentence boundaries, words (tokens) with part of speech annotations and lemma using the Penn tagset, noun and verb chunks, named entities (Person, Location, Organization, Date)
- Written part (80%)
 - Regional and national newspapers
 - Specialist periodicals and journals (various genres)
 - Academic books and popular fiction
 - Governmental docs
- Spoken part (20%)
 - Informal face-to-face conversations (different ages, regions, social classes)
 - Telephone conversations
- <http://www.anc.org/>

Große deutsche Textkorpora

(verschriftlichte Sprache)

- **Deutsches Referenzkorpus – DeReKo**
 - Institut für deutsche Sprache (IdS) Mannheim
 - Zeitungen, Belletristik, Handbücher, Parlamentsprotokolle (seit 1956)
 - Umfang: ca. 42 Mrd. Tokens
 - <http://www1.ids-mannheim.de/kl/projekte/korpora/>
- **Digitales Wörterbuch der deutschen Sprache – DWDS**
 - Berlin-Brandenburgische Akademie der Wissenschaften (BBAW)
 - Zeitungen, Belletristik, Gebrauchsliteratur, Wissenschaft (20./21. Jahrhundert)
 - Umfang: 12,8 Mio Dokumente, ca. 5,5 Mrd. Tokens
 - <https://www.dwds.de/>
- **Deutsches Textarchiv – DTA**
 - Historisches Referenzkorpus: 1600-1900
 - 4422 Werke (ca. 900K Seiten), 297 Mio. Tokens
 - Annotiert mit Tokens, Lemmata, POS
 - <http://www.deutschestextarchiv.de/>

Language Data Repositories

Annotated Language Data

- **Levels of annotation**
 - **Formal text structure processing**
 - Paragraphs, sentences, tokens
 - **Syntactic mark-up**
 - Parts of speech
 - Shallow syntactic structures: chunks
 - Deep syntactic structures: parses
 - **Semantic mark-up**
 - Named entities
 - Propositions, predicate-argument structures
 - **Discourse mark-up**
 - Referential relations
 - Rhetorical relations

Annotation Styles

- In-line annotation
 - Mark-ups appear as integral part of the original text
 - This is an `<XMLTag>` `in-line` `<\XMLTag>` annotation
- Stand-off annotation
 - Mark-ups appear distinct from the original text (e.g., in a different window)
 - This is a `stand-off` annotation
 - `<XMLTag StartChar: 11, XMLTag EndChar: 19, XMLTag Type STAND-OFF>`

General Language Corpora for Syntactic Annotation

- Penn Treebank (U Penn)

- language: English (general language)
- text genre: mostly newspaper articles (*Wall Street Journal*)
- size: 1,200,000 (annotated) tokens
- Syntactic tagging based on set of 45 tags
- Syntactic phrase structures (parse trees) based on Government-Binding grammar
- No named entity annotation
- But propositional annotation: PropBank

<http://www.cis.upenn.edu/~treebank/>

General Language Corpora for Proposition Annotation

- PropBank (U Penn)

- language: English (general language)
 - text genre: financial newspaper articles (*Wall Street Journal*)
 - size: 300,000 (annotated) tokens
 - proposition format:
 - [subject - predicate - object]
 - “semantic” counterpart of Penn Treebank
- <http://www.cis.upenn.edu/~ace/>

General Language Corpora for Discourse Annotation

- **Penn Discourse TreeBank (PDTB; U Penn)**
 - language: English (general language)
 - text genre: financial newspaper articles (*Wall Street Journal*)
 - size: 1 M tokens (WSJ) and 40k relations
 - Annotated with information related to discourse structure and discourse semantics, i.e., temporal, contingency, comparison, and expansion discourse relations (after, when, but, although, if)
 - “discourse” counterpart of **Penn Treebank**
- <http://www.cis.upenn.edu/~pdtb/>

General Language Corpora for Discourse Analysis

- **RST Corpus (ISI/USC, USA)**
 - language: English
 - size: 385 documents, i.e., 176,000 tokens;
21,789 elementary discourse units (EDUs)
 - text genre: newspaper articles (*Wall Street Journal*)
 - Rhetorical Structure Theory (RST)
 - 90 coherence relations

Penn TreeBank: Sizes and Genres

Table 4:
Penn Treebank
(as of 11/92)

Description	Tagged for Part-of-Speech (Tokens)	Shallow Parsing (Tokens)
Dept. of Energy abstracts	231,404	231,404
Dow Jones Newswire stories	3,065,776	1,061,166
Dept. of Agriculture bulletins	78,555	78,555
Library of America texts	105,652	105,652
MUC-3 messages	111,828	111,828
IBM Manual sentences	89,121	89,121
WBUR radio transcripts	11,589	11,589
ATIS sentences	19,832	19,832
Brown Corpus, retagged	1,172,041	1,172,041
Total:	4,885,798	2,881,188

Penn TreeBank POS Tag Set

Table 2:
The Penn Treebank POS tagset

1.	CC	Coordinating conjunction	25.	TO	<i>to</i>
2.	CD	Cardinal number	26.	UH	Interjection
3.	DT	Determiner	27.	VB	Verb, base form
4.	EX	Existential <i>there</i>	28.	VBD	Verb, past tense
5.	FW	Foreign word	29.	VBG	Verb, gerund/present participle
6.	IN	Preposition/subord. conjunction	30.	VBN	Verb, past participle
7.	JJ	Adjective	31.	VBP	Verb, non-3rd ps. sing. present
8.	JJR	Adjective, comparative	32.	VBZ	Verb, 3rd ps. sing. present
9.	JJS	Adjective, superlative	33.	WDT	<i>wh</i> -determiner
10.	LS	List item marker	34.	WP	<i>wh</i> -pronoun
11.	MD	Modal	35.	WP\$	Possessive <i>wh</i> -pronoun
12.	NN	Noun, singular or mass	36.	WRB	<i>wh</i> -adverb
13.	NNS	Noun, plural	37.	#	Pound sign
14.	NNP	Proper noun, singular	38.	\$	Dollar sign
15.	NNPS	Proper noun, plural	39.	.	Sentence-final punctuation
16.	PDT	Predeterminer	40.	,	Comma
17.	POS	Possessive ending	41.	:	Colon, semi-colon
18.	PRP	Personal pronoun	42.	(Left bracket character
19.	PP\$	Possessive pronoun	43.)	Right bracket character
20.	RB	Adverb	44.	"	Straight double quote
21.	RBR	Adverb, comparative	45.	'	Left open single quote
22.	RBS	Adverb, superlative	46.	"	Left open double quote
23.	RP	Particle	47.	'	Right close single quote
24.	SYM	Symbol (mathematical or scientific)	48.	"	Right close double quote

PTB POS Annotation Process

- Four annotators: Grad students of linguistics
- Comparison of two annotation styles on a 16,000 word sample:
 - „Tagging“:
 - completely manual annotation
 - „Correcting“:
 - automatical POS tagging and subsequent manual correction
- Inter-annotator disagreement:
 - „Tagging“: 7,2%
 - „Correcting“: 4,1%
- Comparison of accuracy with benchmark version (disagreement):
 - „Tagging“: 5,4%
 - „Correcting“: 4,0%

Illustration of the „Correcting“ Mode
